

Two in three  
Australians will  
be diagnosed  
with skin cancer  
by the age of 70.

The FDA  
approved drug  
**rapamycin**  
**makes mice**  
**live 60% longer**

and, in some studies, reduces the risk of cancer.

Topical rapamycin could reduce the risk of getting skin cancer, and **adding rapamycin to**

**sunscreen** could be an effective way to deliver it. Liposomal rapamycin is one possibility. It is possible this will also make skin look younger with repeated use.
